PROFESSIONAL SUMMARY

Python backend developer who built and production-deployed five systems on AWS EC2 across internships and personal projects. One of those projects, a real-time crypto trading simulator, attracted direct outreach from a VIP and Partnerships Manager at Crypto.com Exchange, citing the GitHub work as standing out. Proficient in Django, FastAPI, REST APIs, PostgreSQL, Redis, and AWS. Strong foundation in system design, database optimization, async processing, and CI/CD. Active in code reviews and cross-functional debugging at KEP Labs. Immediate joiner, open to relocate anywhere in India.

TECHNICAL SKILLS

- **Languages and Frameworks:** Python, FastAPI, Django, Django REST Framework, Flask
- **Databases and Caching:** PostgreSQL, MongoDB, MySQL, SQLite, Redis
- **Cloud and DevOps:** AWS (EC2, S3, IAM), Docker, Nginx, GitHub Actions, CI/CD, Linux
- **Backend Engineering:** REST APIs, WebSockets, Async Processing, Celery, RabbitMQ, OOP, DBMS
- **Tools:** Git, GitHub, Postman, Jira, SQLAlchemy, Django ORM, Pydantic

PROJECTS

•Crypto Trading Simulator

Jan 2025 – Jun 2025

FastAPI, WebSockets, Redis, PostgreSQL, Docker, GitHub Actions, AWS EC2

GitHub

- Engineered a real-time backend using FastAPI and WebSockets, load-tested to 90+ concurrent connections with consistent message delivery and no dropped connections
- Reduced API latency by 40–60% under high-frequency reads using Redis caching for shared price and portfolio state
- Designed a FIFO-based portfolio engine supporting hundreds of simulated trades per session with accurate real-time P&L tracking
- Automated deployment via GitHub Actions where a push to main triggers a Docker build and ships to AWS EC2 through Nginx

•E-Voting System 2.0

Jul 2025 – Jan 2026

FastAPI, MongoDB, bcrypt, WebSockets, GitHub Actions, AWS EC2

GitHub

- Designed a layered REST API architecture (FastAPI to Services to MongoDB) handling 2,000 to 3,000 concurrent users
- Optimized MongoDB queries with compound indexes on voter ID and election ID fields, keeping high-cardinality reads fast without full collection scans
- Ran vote counting entirely through MongoDB aggregation pipelines on the server side, avoiding Python-side record pulls
- Enforced duplicate-vote prevention at the database level so the constraint holds under race conditions even if application logic is bypassed

•Event-Driven Notification System

Jan 2026 – Feb 2026

FastAPI, RabbitMQ, Celery, PostgreSQL, SendGrid, OAuth2

GitHub

- Designed an event-driven architecture using RabbitMQ to decouple email delivery from the main request flow
- Implemented manual acknowledgments and dead-letter queues so a message is only marked done after confirmed delivery and failed ones route to a retry queue automatically with zero message loss
- Integrated Google OAuth2 for authentication and SendGrid for transactional email with delivery status tracking
- Built a full audit log of every dispatched notification in PostgreSQL with transactional integrity

•Finverse Financial Management Backend

Mar 2026 – Apr 2026

FastAPI, SQLAlchemy, PostgreSQL, Pydantic, Jinja2, Pytest, AWS EC2

GitHub

- Built a financial platform with 3-role RBAC (admin, analyst, viewer) enforced at the FastAPI dependency layer so access control holds on direct API calls and not just through the UI
- Developed 17+ endpoints covering full CRUD, CSV bulk import and export, dynamic filtering, pagination, and analytics views
- Shipped a dual interface with a browser dashboard via Jinja2 and a REST API under /api/* sharing a single auth backend

- Wrote a Pytest suite covering RBAC logic and endpoint behavior including edge cases

•Credit Approval Backend System

Apr 2026 – May 2026

Django REST Framework, Celery, Redis, PostgreSQL, Python

 GitHub

- Built a loan approval backend with a rule-based credit scoring engine mapping income, debt-to-income ratio, and repayment history to an eligibility category and interest rate
- Offloaded heavy loan computation to Celery workers backed by Redis so the API response is never blocked
- Used select_related and prefetch_related throughout the ORM layer with no N+1 queries and no unnecessary database round-trips
- Stored EMI and amortization calculations per credit tier in PostgreSQL with full transactional integrity

ACHIEVEMENTS

- | | |
|-------------------------|---|
| •Crypto.com Recognition | Received direct outreach from a VIP and Partnerships Manager at 2025 Crypto.com Exchange who cited the Crypto Trading Simulator GitHub repository as standing out for its architecture and implementation quality |
| •AWS Educate | Completed 10+ certifications covering cloud infrastructure, compute, databases, storage, networking, and security |
| •LeetCode | Solved 180+ DSA problems covering arrays, recursion, trees, graphs, and dynamic programming |

EDUCATION

•Prestige Institute of Management & Research

2022 – June 2026

B.Tech in Computer Science Engineering

Bhopal, India
